

<b>Program</b>	<b>Proiect NUCLEU PN 09-13-03.07</b>
<b>Project title (ENG):</b>	<b>Phytoremediation of areas polluted with oil products using organic fertilizers type of sewage sludge</b>
<b>Project title (RO):</b>	<b>Fitoremedierea unor arii poluate cu produse petroliere prin utilizarea fertilizatorilor organici de tipul nămolurilor orășănești</b>
<b>Duration</b>	2012-2015
<b>Team Leader</b>	Senior Researcher Eng. Smaranda Măsu
<b>Summary</b> (short description) ENG	<p>They studied variants of phytoremediation of contaminated soils plants with different amounts of crude oil (total petroleum hydrocarbon (TPH)):</p> <ol style="list-style-type: none"> <li>1. ground with low pollution 1g / kg D.M.cultivatted in the following versions: leguminous plants <i>Vicia spp.</i> or <i>Onobrichis spp.</i>, grasses <i>Lolium spp</i> and grasses <i>Lolium spp.</i>;</li> <li>2. average soil pollution with 27,6-28,6g / kg DM cultivated with: legumes <i>Vicia spp.</i> plants or <i>Onobrichis</i> and grasses <i>Lolium spp.</i>;</li> <li>3. soil pollution with <math>18.46 \pm 2</math> 30g / kg D.M. cultivation with <i>Glycine max</i>,</li> <li>4. soil pollution than <math>64.3 \pm 3.5</math> g / kg D.M mice with wild plant (<i>Hordeum murinum</i>)</li> <li>5. sol with high pollution <math>55.45 \pm 0.25</math> g / kg D.M.cultivated with plants of mouse tail</li> <li>6. Very high polluited soil with 113,5g and 80.5 g / kg D.M by culture of small trefoil (<i>Lotus corniculatus</i>).</li> </ol> <p>TPH variants were realized on phytoremediation of polluted soils fertilized with sewage sludge in the absence / presence of additives acting as adsorbent / amendment as indigenous volcanic tuff, ash from coal combustion in power plants fossil plants. For experimental variations of phytoremediation were developed models.</p> <p>Were developed two technologies for phytoremediation of soils contaminated with TPH.</p>
<b>Summary</b> (short description) RO	<p>S-au studiat variante de fitoremediere cu plante a solurilor poluate cu cantități diferite de țăei, (Total petroleum hydrocarbon (TPH)):</p> <ol style="list-style-type: none"> <li>1. sol cu poluare mică de 1g/kg su.,cultivat in variantele: plante leguminoase <i>Vicia spp.</i> sau <i>Onobrichis spp.</i> .., plante graminee <i>Lolium spp.</i>;</li> <li>2. sol cu poluare medie 27,6-28,6g/kg su cultivat in variantele: plante leguminoase <i>Vicia spp.</i> sau <i>Onobrichis spp.</i> plante graminee <i>Lolium spp.</i>;</li> <li>3. sol cu poluare medie <math>18,46\pm2,30</math> g/kg su cultivare cu <i>Glicine max</i>,</li> <li>4. sol cu poluare mare de <math>64,3\pm3,5</math> g / kg su cu planta sălbată orzul şoarecelui (<i>Hordeum murinum</i>),</li> <li>5. sol cu poluare mare <math>55,45\pm0,25</math> g /kg su cu plante din specia coada şoarecelui ;</li> <li>6. sol cu poluare foarte mare 80,5 si 113,5g/kg su prin cultura de ghizdei mărunt (<i>Lotus corniculatus</i>).</li> </ol> <p>Variantele de fitoremediere au fost realizate pe soluri poluate, fertilizate cu namol orasenesc în absenta/prezenta unor adaosuri cu rol de adsorbant/ amendament precum tuful vulcanic indigen, cenusă rezultată din arderea carbunelui fosil în termocentrale termice. Pentru variantele experimentale de fitoremediere s-au elaborat modele. Pe baza modelelor s-au elaborat 2 tehnologii de fitoremediere a solurilor poluate cu TPH.</p>
